

The Tycoon Scheduler Installation Manual

Install Steps:

1. upload all files to the server
2. chmod 777 the templates/templates_c directory
3. Go to your cpanel and create a user and a database
4. Add the user to the database
5. run install.php and follow the steps..

Install Notes:

- a. Use 'localhost' for database server
- b. Leave the Table Prefix field empty if you do not know what it means.

System Setting Notes:

- a. Show Users Per Page: 10 <--how many users per page you'll see in admin.
 - b. Show Messages per Page: 10 <--how many messages per page users will see while using the Tycoon Scheduler.
 - c. Messages per Hour: 10 <-- the number of messages you will allow users to send per hour. It's recommended you keep this number low to avoid abuse of your system. 10-20 tweets per hour should be plenty, but it's YOUR site - you make the rules!
 - d. Days before delete messages: 10 <-- this is the number of days you want to store the sent messages on your server for users to view. If you have plenty of hosting space, you could allow 30 days. If your space is limited, we suggest 10 days.
6. delete install.php
 7. set a cronjob to include/cron.php for every 5 minutes. (this Cron handles tweets)
 8. set a cronjob to include/cron_mail.php for every 20 minutes. (this Cron handles emails)

Cron Settings to paste in your cpanel for MOST servers:

```
php -q /home/networkw/tyc/include/cron_mail.php  
php -q /home/networkw/tyc/include/cron.php
```

9. Enjoy your Tycoon Scheduler!

Additional Notes:

You can use these tags in the emails subject/body for broadcasts and system emails (confirm,welcome,password recovery)

User Tags

[username] - Username
[password] - Password
[email] - Email

Site Tags

[webmaster] - email from webmaster
[site_name] - Site Name
[site_url] - url of the application
[url_confirm] - url to confirm the signup
